BIBLIOGRAPHY

110

CONCLUSION

108

A

Adversary

/ˈadvəəs(ə)ri/

noun

one's opponent in a contest, conflict, or dispute

Aerial

/ˈɛ:riəl/

adjective

existing, happening, or operating in the air.

Aircraft

/ˈɛ:kra:ft/

noun

an aeroplane, helicopter, or other machine capable of flight.

Anomaly

/əˈnom(ə)li/

noun

something that deviates from what is standard, normal, or expected.

Application

/aplɪˈkeɪʃ(ə)n/

noun

a computer program that is designed for a particular purpose.

Artificial intelligence

noun

the theory and development of computer systems able to perform tasks normally requiring human intelligence, such as visual perception, speech recognition, decision-making, and translation between languages.

B

C

Calibrate

/ˈkælibreɪt/

verb

mark (a gauge or instrument) with a standard scale of readings.

Computational

/kəmˈpjʊtɪʃ(ə)n(ə)l/

adjective

- using or relating to computers.
- relating to the process of mathematical calculation.

D

3D

adjective

three-dimensional.

noun

the quality of being three-dimensional.

Database

/ˈdeltəbels/

noun

a structured set of data held in a computer, especially one that is accessible in various ways.

Drone

/drəʊn/

noun

a remote-controlled pilotless aircraft or missile.

E

Exposure

/ɪkˈspəʊzə, ɛkˈspəʊzə/

noun

the action of exposing a photographic film to light.

F

G

Glitch

/ɡlɪtʃ/

noun

verb

a sudden, usually temporary malfunction or fault of equipment.

suffer a sudden malfunction or fault.

Google

/ˈɡuːɡl/

verb

search for information about (someone or something) on the Internet using the search engine Google.

H

I

Image

/ɪmɪdʒ/

noun

- a visible impression obtained by a camera, telescope, microscope, or other device, or displayed on a computer or video screen.
- an optical appearance or counterpart produced by light from an object reflected in a mirror or refracted through a lens.
- a point or set formed by mapping from another point or set.
- an exact copy of a computer's hard disk, made for backing up data or setting up new machines.

verb

make a representation of the external form of.
make a visual representation of (something) by scanning it with a detector or electromagnetic beam.
make an exact copy of (a computer's hard disk).

Infosphere

/ˈɪnfəʊ,sflə/
noun

electronic communication and networking as a whole

J

K

L

Learning

/ˈlɜːnɪŋ/
noun

the acquisition of knowledge or skills through study, experience, or being taught.

Lidar

/ˈlɪdɑː/
noun

a detection system which works on the principle of radar, but uses light from a laser.

M

Machine-readable

/məʃiːnˈriːdəb(ə)l/
adjective

(of data) in a form that a computer can process.

Mapping

/ˈmæpɪŋ/
noun

an operation that associates each element of a given set (the domain) with one or more elements of a second set (the range).

N

Network

/ˈnetwɜːk/
noun

- an arrangement of intersecting horizontal and vertical lines.
- a group or system of interconnected people or things.

verb

- connect as or operate with a network.
- interact with others to exchange information and develop professional or social contacts.

O

Omen

/əʊmən/

noun

an event regarded as a portent of good or evil.

Optical character recognition

noun

the identification of printed characters using photoelectric devices and computer software.

P

Photogrammetry

/fəʊtə(u)'græmɪtri/

noun

the use of photography in surveying and mapping to ascertain measurements between objects.

Pixel

/'pɪks(ə)l, 'pɪksəl/

noun

a minute area of illumination on a display screen, one of many from which an image is composed.

Postcard

/'pəʊs(t)kɑ:d/

noun

a card for sending a message by post without an envelope, typically having a photograph or other illustration on one side.

Privacy

/'prɪvəsi, 'prɪvəsi/

noun

- a state in which one is not observed or disturbed by other people.
- the state of being free from public attention.

Q

QR code

noun

a machine-readable code consisting of an array of black and white squares, typically used for storing URLs or other information for reading by the camera on a smartphone.

R

Recognition

/rɛkəg'nɪs(ə)n/

noun

identification of someone or something or person from previous encounters or knowledge.

acknowledgement of the existence, validity, or legality of something.

Reference

/rɛf(ə)r(ə)ns/

noun

the action of mentioning or alluding to something.

the use of a source of information in order to ascertain something.

Representation

/rɛprɪzɛn'teɪs(ə)n/

noun

- the action of speaking or acting on behalf of someone or the state of being so represented.

- the description or portrayal of someone or something in a particular way.

Resolution

/rɛzə'lu:ʃ(ə)n/

noun

the smallest interval measurable by a telescope or other scientific instrument; the resolving power.

Robot

/rəʊbɒt/

noun

(especially in science fiction) a machine resembling a human being and able to replicate certain human movements and functions automatically.

S

Satellite

/'satəlAɪt/

noun

an artificial body placed in orbit round the earth or moon or another planet in order to collect information or for communication.

Scan

/skan/

verb

- look at all parts of (something) carefully in order to detect some feature

- cause (a surface, object, or part of the body) to be traversed by a detector or an electromagnetic beam.

Sensor

/'sensə/

noun

a device which detects or measures a physical property and records, indicates, or otherwise responds to it.

Surveying

/sə'vellɪŋ/

noun

the profession or work of examining and recording the area and features of a piece of land so as to construct a map, plan, or detailed description of it.

T

Target

/tɑ:ɡɪt/

noun

verb

a person, object, or place selected as the aim of an attack.

select as an object of attention or attack.

Trick

/trɪk/

verb

cunningly deceive or outwit.

U

V

View

/vju: /

noun

verb

the ability to see something or to be seen from a particular place.

look at or inspect.

regard in a particular light or with a particular attitude.

Visual

/vɪz(j)uəl, 'vɪzjuəl/

adjective

noun

relating to seeing or sight.

a picture, piece of film, or display used to illustrate or accompany something.

INTRODUCTION

AUTOMATION is everywhere. The radical evolution of technology in the last decades has forever changed our world, and had a huge impact on the society we live in today. In this field guide we pose four **QUESTIONS**:

HOW HAS OUR VIEW OF THE WORLD **CHANGED** WITH THE **ARRIVAL** OF THESE NEW AUTOMATED TECHNOLOGIES?

HOW DO THESE TECHNOLOGIES **PROCESS** THE IMAGES WE FEED THEM AND HOW DO THEY **PERCEIVE** OUR WORLD?

HOW CAN INTERNAL VISION **SEE** THESE **VISIBLE** THINGS IN A DIFFERENT WAY **UNDER** THE SURFACE?

We end the field guide with a summary of what we have learned, while posing a final question that may be in the field of artificial intelligence.

WE MAKE THE
WORKINGS OF
MACHINES
E TO US IN A
WE CAN
STAND?

WHAT KIND OF NEW
AESTHETIC HAVE
WE DEVELOPED BECAUSE
OF NEW TECHNOLOGIES?

The field guide first goes through 37 CASES on ways in which automation has created a different lookout on technology and also our world.

guide with our own EXPERIMENTS using what we have
ing the question what the impact of these new eyes can
chitecture.

**How has
changed
new auto**

Automation gives us
a new perspective.
New angles to look
at our world, our
society, nature or
architecture. Thanks
to automated
machines we can see
things we knew in a
new, fresh way.

**our view of the world
with the arrival of these
automated technologies?**

HOW HAS OUR VIEW OF THE WORLD CHANGED WITH THE ARRIVAL OF THESE NEW TECHNOLOGIES?

#artificial intelligence

#database

#image

#learning

#network

#recognition

A peek inside the black box of a neural network.

Carter and his team reverse-engineered the internal workings of a neural network. They trained the machine to recognise a wide variety of images, and then told the neural network to generate an image of for example a dog based on what it had learned. This way we can get a peek inside the internal workings, and see how a deep learning machine processes and distinguished images.

Amur leopard
WWF

Amur Leopard. Estimated about 60 remain

We, as humans, only recognise what's in a picture if the pixel count is high enough. This WWF project plays on that idea: The amount of pixels in the picture represent how many of a species are left in the wild, thus giving us a powerful visual reminder.

HOW HAS OUR VIEW OF THE WORLD CHANGED WITH THE ARRIVAL OF THESE NEW TECHNOLOGIES?

Deep neural networks can now transfer the style of one photo onto another

And the results are impressive

By James Vincent | Mar 30, 2017, 1:53pm EDT

f   SHARE

How is AI changing photography?

This newly developed technique allows you to transfer a photo style from a reference onto your own photograph. It differs from a simple style transfer in that it takes into account the edges of objects in the pictures instead of blindly pasting a style. So the resulting image will look like a realistic photograph rather than a painterly style.

#visual

Pixeldrifter
Dmitriy Krotevich

By default, each pixel tries to find the 'weakest' pixel among its closest neighbors and if one is found, they swap their positions

Also pixels with a higher 'power' value can do more 'swaps.' Put differently, the pixels are imbued with enough intelligence to behave autonomously, although Krotevich says, "an experienced user can predict a result."

talking Mona Lisa
Samsung

Imagine the lips forming the Mona Lisa's famous smile were to part, and she began "speaking" to you.

Researchers from Samsung AI lab and Skolkovo Institute of Science and Technology used adversarial learning to generate a photorealistic talking head model. The model finds face landmarks from video sequences in these datasets, based on the target person transforms them into a set of realistic photographs and then combines the images to create a video/gif with the target person animated as if in speech.

Using this technique on a person of Lisa Gherardini, the subject of Leonardo da Vinci's classic 16th century portrait, shows the impact of technology on extruded perception of art we already know.

Nine eyes - Google Street View
Jon Rafman

Nine Eyes of Google Street View is both an archival project and a conceptual meditation on the state of photography in a time of automated image-making on a massive scale.

Here, the artist collects images from google street view. The technique itself is meant to blindly capture the environment with no regard towards aesthetics, but Jon Rafman manages to find beauty within it.

Clement Valla

The artist collects images where Google Earth shows us something strange that we might perceive as glitches. But in fact, they are not 'glitches' or mistakes but rather show us how Google Earth works: It uses a 3d model of the Earth and overlaps it with visual images from satellites. Sometimes these two forms of data don't match up and this creates interesting visuals.

Forensi architecture

Cameras record on both sides of the lens: the objects, people, and spaces they capture, and the position and movement of the invisible photographer.

In this project we see how you can break down what is happening at a scene based on the movement of the invisible actor, the person filming. The fact that they started filming the window tells us that they perceived a danger coming from outside, and erratic movement demonstrated a sense of danger. By analysing images in this way we get a better understanding of events.

understanding robots

Automated devices have their own language and perspective which are not readable for humans in any way. But our understanding of their actions is not necessary while they're working with other automated devices - they can understand each other perfectly.

Janelle Shane known from her blog [aiweirdness.com](#) has put two AI bots against each other and the result of the experiment showed that things which are wrong and confusing for us, can be readable and right for automated devices.

“Every city, every town, every home is filed with an invisible network of competing signals”

British Telecom
'BT Smart Wireless Home Hub'

The project of Timo Arnall and its co-authors (Jørn Knutsen, Einar Sneve Martinussen) aims to illustrate invisible to the human eye wi-fi networks in urban spaces through the use of photographic technique called light-painting. We can see how WiFi network behaves and changes in urban space, how it is influenced by buildings, people and the structure of the city.

Landscapes are made for Satellite Eyes

This is an example of a satellite calibration target, which were built to give aircraft mounted cameras something on which to focus their lenses, allowing them to test their resolution and ability to take clear pictures at high speeds. The resulting properly calibrated satellites could then go on to do the work for which they were meant: spying.

The 20-meter-wide zigzagging white lines are calibration targets for spy satellites. The calibration targets are larger than might be expected — 1 by 1.8 kilometers — suggesting that the satellite cameras they are being used to calibrate have surprisingly poor ground resolution.

A 32 x 32 inch square of dirt made by Helmut Smiths looks like one dead pixel from an altitude of 1 kilometer in Google Earth.

This “missing pixel” is an interesting way of placing emphasis on the seemingly immaterial nature of digitized information, such as the satellite photography used to populate the data sphere of Google Earth. The virtual equivalent of this project might be to remove a single pixel from the website’s homepage just to see if anyone notices the deletion.

An aerial photograph of an industrial facility, possibly a refinery or chemical plant, situated in a vast, arid desert landscape. The facility consists of several large, interconnected buildings and structures, with a prominent area of red-roofed storage tanks or containers. The surrounding terrain is dry and brown, with some sparse vegetation and a network of roads or tracks. The image is presented in a vertical orientation.

For aerial photography, it provides a platform to test, calibrate, and focus aerial cameras as traveling at different speeds and altitudes. The targets can also be used in the same way by satellites.

CLUI kite
Cris Benton

The targets function like an eye chart at the optometrist, where the smallest group of bars that can be resolved marks the limit of the resolution for the optical instrument that is being used.

Space 360 - Spherical Projection Theater
Gwangju, South Korea June 1-14, 2017

Space 360
Barco

A sphere building with a glass walking bridge was designed solely for projecting 360 movies on it.

Space 360 can be considered a true VR theater of the future.

A series of prototypical objects explore the form and materiality of stealth and subversion. Each object starts life as an intuitively carved wooden sketch. These then become 3D notebooks on which to design precise insertions and additions. The objects are then 3D scanned using a self built scanner to enable precision inserts to be machined and added to the originals. Matthew Shaw's project aims to subvert mapping, by arming the population with the tools to edit the way their city is scanned and recorded.

Prototype
Matthew Shaw

These tools are not digital hacks but physical interventions. They manipulate the scanning process and act as waypoints and markers linking the physical world to the digital.

-Heinrich Hertz*

In person, these hanging lanterns look like typical white lights. On camera, however, they appear to strobe with bands of color. We cannot see radio waves with the bare eye, but through a project like this the technology becomes something we can see.

The tribal styling references the way social networks are often described as online tribes.

QR U?
Thorunn Arnadottir

The QR U? dress features graphic codes that a mobile app can recognise and translate into images, links to websites or text.

The image features a dense grid of QR codes. A central doorway is visible, leading to a brightly lit area. The floor is highly reflective, mirroring the QR code pattern above. A purple and white rectangular bar is located in the top left corner.

The milestone
MVRDV

Extruded and indented blocks on the square grid of the facade will give the building a 3D profile that the architects describe as a "pixelated map". Passersby will be able to use their phones to interact with the facade, which will be printed with QR codes that reveal information about the city.

"Each pixel carries different information, featuring the stories of the city and its inhabitants. Accompanied by a smartphone app one can discover its richness, creating the public library of the town," MVRDV explained.

What if we could start transferring rendered styles onto existing architecture?

EXPERIMENT WITH STYLE TRANSFER

+

=

An aerial, top-down view of a city. The central focus is a large, white, rectangular building with a grid-like pattern on its roof. Surrounding this central building are numerous smaller buildings with various colored roofs, including red, orange, and brown. The city is partially obscured by thick, white, misty clouds that drift across the scene, creating a sense of depth and atmosphere. The overall lighting is bright, suggesting a clear day.
